Specific Accreditation Criteria
Reference Material Producers ISO 17034
Annex

Reference Grain Producers

January 2018
Reference Grain Producers

This document provides interpretative criteria and recommendations for the application of ISO 17034 for Reference Material Producers (RMP) for both applicant and accredited facilities.

Applicant and accredited facilities must also comply with ISO 17034 and the NATA ISO 17034 Standard Application Document (SAD).

The clause numbers in this document follow those of ISO 17034 General requirements for the competence of reference material producers but since not all clauses require interpretation the numbering may not be consecutive.

This annex details specific requirements for accreditation of reference grain producers under the following categories and sub-categories of reference materials.

**CATEGORY A  CHEMICAL COMPOSITION**

**A3** Organic reference materials

**A3.2** Agricultural materials, fertilisers

**A3.3** Foodstuffs

- Proximate analysis
- Nutritional properties
- Vitamins
- Other food additives
  - antioxidants
  - emulsifiers
- Toxins
  - animal origin
  - plant origin
  - other biological origin
- Trace elements
- Trace organics
  - pesticide residues
  - other organic contaminants

The accreditation of reference grains covers measuring, characterising and assigning values for protein content in wheat and barley (e.g. using the Dumas and Near-infrared (NIR) spectroscopic techniques). The addition of other types of grain materials will be considered on request. The Scope of Accreditation for the production of reference grains will include the following comments, as applicable, under the relevant sub-categories:

- Production of a certified reference material for total protein analysis in wheat and barley and assigning of a property value and associated uncertainty of measurement by Dumas combustion.
- Production of a certified reference material for total protein analysis in wheat and barley and assigning of a property value and associated uncertainty of measurement by NIR techniques.

The clause numbers in this section follow those of ISO 17034 but since not all clauses require interpretation the numbering may not be consecutive.

6.3 Provision of equipment, services and supplies

6.3.3 For NIR instrumentation, the facility must ensure information regarding the reference grains and/or control check samples used for checking the (daily) stability of the instrument is maintained.

6.3.4 Records of grain suppliers whose grain is used for collaborative studies must be maintained.

7.4 Material handling and storage

Samples should be stored dry in airtight containers when not in use, at ambient room temperature and away from direct sunlight.

7.16 Control of quality and technical records

7.16.2 For each batch of candidate and reference grain held by the facility, the following details, as a minimum, must be recorded:

- storage location;
- type of grain;
- quantity of grain;
- indicative value.

For reference grain, the following information must also be recorded:

- assigned value of grain, if possible;
- date produced;
- regulatory conditions applying to the grain e.g. in relation to quarantine, export, containment levels etc.
References
This section lists publications referenced in this document. The year of publication is not included as it is expected that only current versions of the references shall be used.
